

Final Project Assignment

Use case 1: Administer User Profile (6 value points)

Participating Actors

The use case is initiated by an Administrator.

Brief Description

The use case allows the Administrator to change the profile information related to a user.

Assumptions

The Administrator is logged into the system. Refer to **At-least-One-Administrator** and **Initial-Administrator** rules below.

Flow of Events

Basic Flow

1. The use case starts when the Administrator elects to administer the profile of a specific user.
2. The system displays the user profile elements (Refer to User Profile Rule below, under **Profile Element**)
3. The Administrator makes one or more changes to the profile (Refer to User Profile Rule below, under **Administrator Action**)
4. The system takes the appropriate action (Refer to User Profile Rule below, under **System Action**) and stores any changes.

Rules

- **At-least-One-Administrator Rule:** There is at least one active Administrator in the system.
- **Initial-Administrator Rule:** Out of the box, the system comes with an Administrator user defined as follows:

Username	ESNAdmin
Password	admin
Privilege	Administrator
Status	OK

- **User Profile Rule:**

Profile Element	Administrator Action	System Action
Account Status	Could switch any user's account between Active & Inactive .	Refer to Active / Inactive rule.

Privilege Level	Could switch any user's account among Administrator, Coordinator, Citizen . By default, any new account created has the Citizen privilege.	Refer to Privilege Rule below.
Username	Could change any user's username	Verify that the change follows the Username Rule (under Join Community use case).
Password	Could change any user's password	Verify that the change follows the Password Rule (under Join Community use case).

- **Privilege Rule:**

Privilege Level	Possible Actions
Citizen	Users at this level of privilege can perform all the use cases that the Citizen actor can initiate (refer to Use Case Survey)
Coordinator	Users at this level of privilege can perform all the use cases that the Citizen & Coordinator actors can initiate (refer to Use Case Survey)
Administrator	Users at this level of privilege can perform all the use cases that the Citizen, Coordinator & Administrator actors can initiate (refer to Use Case Survey)

- **Active / Inactive Rule:**

- **Active** is the default status of an account.
- A logged in user whose account becomes **Inactive** is logged out of the system with an informing message.
- A logged out user whose account becomes **Inactive** cannot log in to the system any longer but receives an informing message upon trying.
- Information related to an **Active** account is visible to other users as applicable.
- Information related to an **Inactive** account (including messages and announcements) remains in the system but is invisible to all users (except for User Profile information, which is visible to the Administrator for administration purposes).

Use Case 2: Post Announcement (3 value point)

Participating Actors

The use case is initiated by a Coordinator.

Brief Description

The use case allows the Coordinator to post a public announcement.

Assumptions

The Coordinator is logged into the system.

Use the concept of *privilege* to restrict this use case to a subset of Citizens called “**Coordinator**”.

This means that only a “Coordinator” can post an announcement.

Flow of Events

Basic Flow

1. The use case starts when the Coordinator elects to post a public announcement.
2. The system displays the latest public announcements and provides a space to create a new one.
3. The Coordinator creates a public announcement.
4. The system stores and displays the announcement (together with sender name and timestamp) so everyone can see it.

Alternative Flows [all mandatory]

- A1. In step 2, if there are no existing public announcements, none is displayed. The system provides a space to create one and proceeds to step 3.
